Immutable data structure ¶

1. String

Access the characters of string

1. By using index

```
In [3]:
          1 s="Hello World"
          2 print(s[2])
          3 print(s[5])
          4 print(s[20])
        1
        IndexError
                                                   Traceback (most recent call last)
        <ipython-input-3-33226ec3376f> in <module>
              2 print(s[2])
              3 print(s[5])
        ----> 4 print(s[20])
        IndexError: string index out of range
          1 s="Arman"
In [2]:
          2 print(s[3])
          3 print(s[-2])
        а
        а
          2. By using slicing operator
            Syntax---> s[begin index:end index:step]
```

```
In [10]:
           1 s="Learning Python is very easy."
           2 print(s[1:7:1])
           3 print(s[1:7])
           4 print(s[:7])
           5 print(s[5:])
           6 print(s[1:7:2])
           7 print(s[::2])
           8 print(s[:])
           9
             print(s[::])
          10 | print(s[::-1]) #only for string not for number
          11 print(s[-5::])
          12
             print(s[-5:-1:])
          13 print(s[7:1:-1])
         earnin
         earnin
         Learnin
         ing Python is very easy.
         eri
         Lann yhni eyes.
         Learning Python is very easy.
         Learning Python is very easy.
         .ysae yrev si nohtyP gninraeL
         easy.
         easy
         gninra
```

Check whether the given string is palindrome or not

Enter string:sas sas is a palindrome string

Mathematical operators for string

```
+ ---> String concatenation
* ---> String repetation
```

```
In [16]: 1 print("Arman"+"Arman")
2 print("Arman"*3)
```

ArmanArman ArmanArmanArman

Comparison of String

```
In [20]: 1 s1=input("Enter string 1:")
2 s2=input("Enter string 2:")
3 if(s1==s2):
4     print("Both strings are equal.")
5 elif(s1<s2):
6     print("Second string is greater.")
7 else:
8     print("First string is greater.")</pre>
```

```
Enter string 1:Arman\
Enter string 2:ARyan
First string is greater.
```

Joining of string

Join a group of strings wrt the given separator

Syntax---> s=separator.join(group of string)

Arman\$Aryan\$Dhairya

Formatting of string

Important functions of string

Aryan's salary is 40000 and age is 24

```
1. len()
```

```
In [25]: 1 s="Aryan"
2 print(len(s))
```

Removing spaces from string

1. lstrip()

2. rstrip()

```
3. strip()
In [27]:
           1 s="banana "
           2 print(len(s))
           3 x=s.rstrip()
           4 print(x)
           5 print(len(x))
         7
         banana
         6
In [29]:
           1 s=" banana"
           2 print(s)
           3 x=s.lstrip()
           4 print(x)
           banana
         banana
In [30]:
           1 s=" banana "
           2 print(s)
           3 x=s.strip()
           4 print(x)
           banana
         banana
In [31]:
           1 s="banana"
           2 x=s.rstrip("a")
           3 print(x)
         banan
In [32]:
           1 s="banana "
           2 x=s.rstrip("a")
           3 print(x)
         banana
In [34]:
           1 s="banana"
           2 x=s.rstrip("na")
             print(x)
         b
In [35]:
           1 s="bamana"
           2 x=s.rstrip("na")
           3
             print(x)
```

bam

anana

Changing the case of string

```
1. upper()
```

- 2. lower()
- 3. swapcase()
- 4. title()
- 5. capitalize()

```
In [39]:
           1 s="Hello World"
           2 x=s.upper()
           3 y=s.lower()
          4 print(x)
          5 print(y)
           6 z=s.swapcase()
           7 print(z)
         HELLO WORLD
         hello world
         hELLO wORLD
In [40]:
          1 s="HELLO HOW ARE YOU"
           2 x=s.title()
           3 print(x)
          4 y=s.capitalize()
```

Hello How Are You Hello how are you

5 print(y)

To check type of characters present in a string(check function)

```
---> Answer only in True or False
```

1. isalnum()

Returns True if all characters are alphanumeric(a-z,A-Z,0-9)

True

```
1 x="Company 123"
In [42]:
              print(x.isalnum())
          False
           2. isalpha()
           3. isdigit()
           4. isnumeric()
In [45]:
           1 x="CompanyX"
           2 print(x.isalpha())
           3 y="Company 123"
           4 print(y.isalpha())
          True
          False
In [46]:
           1 x="50525"
           2 print(x.isdigit())
           3 y="50525xyz"
           4 print(y.isdigit())
          True
          False

              print(avg)
```

6 7 4 23 3.2857142857142856

find()

Returns index of first occurence of the given substring if it is not available then we will get -1

Syntax---> s.find(substring)

```
s="Learning Python is very easy."
In [9]:
             print(s.find("a"))
          2
             print(s.find("s"))
             print(s.find("x"))
             print(s.find(" "))
             print(s.find("Python"))
             print(s.find("s v"))
             print(s.find("a",3,))
        2
        17
        -1
        8
        9
        17
        25
```

count()

replace()

To replace old string with new string.

Syntax---> s.replace(old string,new string)

Learning Python is easy. LeArning JAvA is eAsy.

split()

translate() with maketrans() function

```
In [29]: 1 import string
2 print(string.punctuation)
3 print(len(string.punctuation))
!"#$%&'()*+,-./:;<=>?@[\]^_`{|}~
32
```

maketrans():make translation table

mapping of character to their replacement or to none for deletion

Syntax---> maketrans(from_chars,to_chars,delete_chars)

translate()

- Applies to translation table created by maketrans()
- returns new string with characters replaced or deleted according to table.

```
In [36]:
           1 import string
           2 s="Py$@tg!!on"
           3 l=s.maketrans("","",string.punctuation)
          4 x=s.translate(1)
          5 y=s.maketrans("","","@$")
           6 z=s.maketrans("n","m","@$")
           7 print(x)
          8 print(y)
          9 print(z)
          10 n=s.translate(z)
          11 print(n)
         Pytgon
         {64: None, 36: None}
         {110: 109, 64: None, 36: None}
         Pytg!!om
In [38]:
          1 t="Hello Sam!!"
          2 x="mSa"
          3 y="eJo"
          4 table=t.maketrans(x,y)
           5 print(t.translate(table))
         Hello Joe!!
```

Write a program to replace each special symbol with # for following string

##John is #developer # musician##

Write a program to remove ith character from the string

Helo World

Write a program to find the count of all occurences of a substring in a given string by ignoring the case

Write a program to display all positions of substring in a given string

```
In [12]:
           1 s="abcdabcacdab"
           2 l=s.count("a")
           3 sub="a"
           4 pos=0
           5 for i in s:
           6
                  if(i==sub):
           7
                      print(sub, "found on", pos, "position.")
           8
                  pos+=1
              print("count:",1)
         a found on 0 position.
         a found on 4 position.
         a found on 7 position.
         a found on 10 position.
         count: 4
```

Write a program to merge characters of two strings into a single string by taking characters alternatively
